Next.js Basics

Topic Focus

- project setup
- app router structure
- pages
- components
- basic styling

5 Basic Tasks

1. Create a new Next.js project.
2. Run the project locally and verify it opens in browser.
3. Remove default content and create a homepage with the title: `Intern Training Portal`.
4. Create a separate component called `Header` and display it on the homepage.
5. Add a simple footer component and show copyright text.

5 Intermediate Tasks

1. Create a `components` folder and move all reusable UI into it.
2. Create an `about` page and show company/training information.
3. Create a `contact` page with email and phone details.
4. Add a navigation section to move between Home, About, and Contact.
5. Apply simple CSS module styling to homepage title, header, and footer.

5 Advanced Tasks

1. Create a `dashboard` page with 3 cards:
    - Total Interns
    - Total Trainers
    - Total Tasks
2. Build a reusable `Card` component and use it for all dashboard cards.
3. Add a global layout so header and footer appear on all pages.
4. Create a `not-found` style custom page message for wrong routes.
5. Write the app with proper folder structure and clean naming conventions.

Routing, Layouts, Navigation, Images, Interactivity

Topic Focus

- app routing

- nested layouts
- `Link`
- image handling
- client-side interactivity basics

5 Basic Tasks

1. Create pages for:
    - `/services`
    - `/courses`
    - `/trainers`
2. Add navigation links for these pages.
3. Show different heading text on each page.
4. Add one local image to homepage.
5. Display a list of 3 training courses on `/courses`.

5 Intermediate Tasks

1. Create a nested route `/dashboard/profile`.
2. Create another nested route `/dashboard/settings`.
3. Add a dashboard sidebar with links to Profile and Settings.
4. Use a layout so the sidebar appears on both dashboard pages.
5. Create a client component with a button that increments a count.

5 Advanced Tasks

1. Build a course listing page with:
    - course image
    - title
    - duration
    - level
2. Create a reusable `CourseCard` component.
3. Add a search input UI for courses.
4. Show a “No courses found” message when list is empty.
5. Create a simple dark/light-style toggle using state only.
